-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 11 April 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-3, 10-12, 19-34 and 36-48 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-3, 10-12, 19-34 and 36-48 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

KAMBIZ ZAND
PRIMARY EXAMINER

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____

DETAILED ACTION

1. This Office action is in response to the amendment filed on April 11, 2006.
2. Claims 1-3, 10-12, 19-34 and 36-48 are pending.
3. Claims 1-3, 10 and 36 are amended.
4. Claim 4-9, 13-18 and 35 are canceled.

Response to Amendment

5. The 112/2nd paragraph rejection to claim 36 is withdrawn as the amendment overcomes the 112/2nd paragraph rejection.

Response to Arguments

6. Applicant's arguments (see pgs. 10-11, "Remarks"), with respect to the prior art rejection(s) of claim(s) have been fully considered and are persuasive. Therefore, the rejections have been withdrawn. In particular, Halsall only discloses a column parity bit vector wherein the data values and not the row parity bits are combined using a commutative operation. (pg. 129, figure 3.15) This method of establishing the column parity bit vector is distinct from the commutative checksum of the claimed invention in that the claims recite the segment checksums themselves are combined to form the commutative checksum. However, upon further consideration, a new ground(s) of rejection is made in view of Kilner USPN 5,649,089 in view of Frezza et al. USPN 4,982,430 as outlined below.

Claim Rejections - 35 USC § 103

7. Claims 1-3, 10, 19-33, 37, 40, 43 and 46 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kilner USPN 5,649,089 in view of Frezza et al. U.S. Patent No. 4,982,430 (hereinafter Frezza); subject matter in McNamara et al. USPN 4,533,948 is relied upon since the McNamara patent is incorporated by reference into the Frezza patent (hereinafter McNamara).

8. As per claim 10, Kilner discloses an arrangement for forming a first commutative checksum for digital data which are grouped into a number of data segments, the arrangement comprising:

- a. an arithmetic and logic unit, (fig. 1, reference nos. 112 and 115)
- b. a first segment checksum, which is formed for each said data segment, (fig. 1, reference no. 124)
- c. a commutative operation which forms the first commutative checksum by operating on the segment checksums. (fig. 1, reference no. 130)

9. Kilner does not cover a cryptographic operation to protect the first commutative checksum. Frezza teaches encrypting integrity values prior to submitting the integrity value over a network link to prevent unauthorized alteration of a message. Frezza, col. 2:45-3:13. It would be obvious to one of ordinary skill in the art at the time the invention was made to implement a cryptographic operation to secure the first commutative checksum. One would be motivated to do so to prevent an unscrupulous third party

from an unauthorized modification of a transmitted message (Frezza, col. 2:20-25). The aforementioned cover the limitations of claim 10.

10. As per claim 37, Kilner in view of Frezza cover the following: 1) an arrangement for forming a first commutative checksum, 2) an arrangement for checking a predetermined cryptographic commutative checksum, and 3) an arrangement for forming and checking a first commutative checksum as outlined above in the claim 10 rejection 35 U.S.C. 103(a). In addition, the cryptographic operations described use a symmetric key methodology (Frezza, col. 1:12-19; 5:50-58; McNamara, 7:34-42; 8:25-35).

11. As per claims 40, Kilner in view of Frezza cover the following: 1) an arrangement for forming a first commutative checksum, 2) an arrangement for checking a predetermined cryptographic commutative checksum, and 3) an arrangement for forming and checking a first commutative checksum as outlined above in the claim 10 rejection under 35 U.S.C. 103(a). In addition, Kilner teaches the commutative operation to establish column parity, which forms the commutative checksums, is an XOR operation (Kilner, col. 3:52-65): the XOR operation exhibits both commutative and associative properties. The aforementioned cover the limitation of claim 40.

12. As per claim 43, Kilner in view of Frezza cover an arrangement as outlined above in the claim 10 rejection under 35 U.S.C. 103(a). Kilner does not expressly disclose

Art Unit: 2132

archiving the digital data and the cryptographic commutative checksum. However, archiving the elements of a transmission is a standard feature to verify the contents of a transmission to an auditor. The examiner takes Official Notice that archiving transmission elements are standard means to record the transmission to prove the contents and status of the transmission at a latter date (i.e. auditing a transmission). It would be obvious to one of ordinary skill in the art at the time the invention was made to archive the digital data and the checksum since it preserves a receipt of the transmission. The aforementioned cover the limitations of claim 43.

13. As per claim 46, Kilner in view of Frezza cover the following: 1) an arrangement for forming a first commutative checksum, 2) an arrangement for checking a predetermined cryptographic commutative checksum, and 3) an arrangement for forming and checking a first commutative checksum as outlined above in the claim 10 rejections under 35 U.S.C. 103(a). In addition, as mentioned previously, the digital data is cryptographically protected, and by convention, the cryptographic operation would be implemented by an ALU. Furthermore, since Kilner discloses sending the digital data as well as the checksum values and commutative checksum value from the active database to a standby database over a network link (col. 3:14-19, and figs.1-4), and Frezza teaches securing the integrity value being transmitting over a digital network, the digital data would necessarily be processed in accordance with a network management protocol. The aforementioned cover the limitation of claim 46.

14. As per claims 1-3 and 22-33, they are method claims corresponding to the subject matter covered in the rejections of claims 10, 37, 40, 43 and 46, and they do not teach or define above the information covered in the rejections of claims 10, 37, 40, 43 and 46. Therefore, claims 1-3 and 22-33 are rejected under Kilner in view of Frezza for the same reasons set forth in the rejections of claims 10, 37, 40, 43 and 46.

15. As per claims 19-21, the rejections of claims 1-3 under 35 USC 103(a) as being unpatentable over Kilner in view of Frezza is incorporated herein. (supra) In addition, the method further comprising the step of: forming the first segment checksums and the second segment checksums in accordance with a type selected from the group consisting of a hashing value, a CRC code, and a cryptographic one-way function (Kilner, col. 3:38).

16. Claims 11, 12, 34, 36, 38, 39, 41, 42, 44, 45, 47 and 48 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kilner in view of Frezza (the subject matter of McNamera is dependent upon since McNamera is incorporated by reference into the Frezza patent), and further in view of Mattison USPN 5,778,070 (hereinafter Mattison).

17. As per claim 11, Kilner in view of Frezza cover an arrangement as outlined above in the claim 10 rejection under 35 U.S.C. 103(a). In addition, the arrangement also includes the following:

d. the allocation of the predetermined cryptographic checksum to the digital data and the subjection of the cryptographic commutative checksum to an inverse cryptographic operation to form a first commutative checksum (Frezza, col. 1:12-19; 5:50-58; McNamara, 7:34-42; 8:25-35; any message encrypted by DES has an inverse operation (decryption) to retrieve the original message; furthermore, every ciphertext is associated with a specific plaintext);

e. the formation of a second segment checksum for each data segment, the formation of a second commutative checksum by a commutative operation on the second segment checksums, and a comparison of the first commutative checksum and the second commutative checksum for a match (Kilner, 4:10-26).

18. Kilner does not teach the second segment checksum is formed in accordance with a type selected from the group consisting of a hashing value and a cryptographic one-way function. However, the use of a hashing value as a checksum is a well known means to ensure the integrity of a data segment. For example, Mattison discloses hashing as a more rigorous means than a typical checksum to ensure data integrity since a hash of a data block is unique to that data block and any modification to the data block will modify the hash (5:20-34). Therefore, it would be obvious to one of ordinary skill in the art at the time the invention was made for the segment checksum to be a hashing value. One would be motivated to do so to establish a more rigorous integrity check on the data segments. The aforementioned cover the limitations of claim 11.

Art Unit: 2132

19. As per claim 12, since the second segment checksum (the checksum to verify an integrity value) is a hash value, the first segment checksum (the checksum to form an integrity value) is also a hash value. Hence, the above arrangements outlined in the claim 10 and 11 rejections under 35 U.S.C. 103(a) together covers the arrangement outlined in claim 12.

20. As per claims 34 and 36, they are method claims corresponding to claims 11 and 12, and they do not teach or define above the information claimed in claims 11 and 12. Therefore, claims 34 and 36 are rejected under Kilner in view of Frezza and Mattison for the same reasons set forth in the rejections of claims 11 and 12.

21. As per claims 38 and 39, Kilner in view of Frezza and Mattison cover the following: 1) an arrangement for forming a first commutative checksum, 2) an arrangement for checking a predetermined cryptographic commutative checksum, and 3) an arrangement for forming and checking a first commutative checksum as outlined above in the claim 11 and 12 rejections under 35 U.S.C. 103(a). In addition, the cryptographic operations described use a symmetric key methodology (Frezza, col. 1:12-19; 5:50-58; McNamara, 7:34-42; 8:25-35).

22. As per claims 41 and 42, Kilner in view of Frezza and Mattison cover the following: 1) an arrangement for forming a first commutative checksum, 2) an arrangement for checking a predetermined cryptographic commutative checksum, and

3) an arrangement for forming and checking a first commutative checksum as outlined above in the claim 11 and 12 rejections under 35 U.S.C. 103(a). In addition, Kilner teaches the commutative operation to establish column parity, which forms the commutative checksums, is an XOR operation (Kilner, col. 3:52-65): the XOR operation exhibits both commutative and associative properties. The aforementioned cover the limitations of claims 41 and 42.

23. As per claims 44 and 45, Kilner in view of Frezza and Mattison cover an arrangement as outlined above in the claim 11 and 12 rejections under 35 U.S.C. 103(a). Kilner does not expressly disclose archiving the digital data and the cryptographic commutative checksum. However, archiving the elements of a transmission is a standard feature to verify the contents of a transmission to an auditor. The examiner takes Official Notice that archiving transmission elements are standard means to record the transmission to prove the contents and status of the transmission at a latter date (i.e. auditing a transmission). It would be obvious to one of ordinary skill in the art at the time the invention was made to archive the digital data and the checksum since it preserves a receipt of the transmission. The aforementioned cover the limitations of claims 44 and 45.

24. As per claims 47 and 48, Kilner in view of Frezza and Mattison cover the following: 1) an arrangement for forming a first commutative checksum, 2) an arrangement for checking a predetermined cryptographic commutative checksum, and

3) an arrangement for forming and checking a first commutative checksum as outlined above in the claim 11 and 12 rejections under 35 U.S.C. 103(a). In addition, as mentioned previously, the digital data is cryptographically protected, and by convention, the cryptographic operation would be implemented by an ALU. Furthermore, since Kilner discloses sending the digital data as well as the checksum values and commutative checksum value from the active database to a standby database over a network link (col. 3:14-19, and figs.1-4), and Frezza teaches securing the integrity value being transmitting over a digital network, the digital data would necessarily be processed in accordance with a network management protocol. The aforementioned cover the limitations of claims 47 and 48.

Communications Inquiry

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jung W. Kim whose telephone number is 571-272-3804. The examiner can normally be reached on M-F 9:00-5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gilberto Barron can be reached on 571-272-3799. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should
